## Wave Functions

## Gauge interactions

## Gravitation

## Conclusion

## Bonus Material

---

(1)	$dW = 0$	Action $W = \int L dt$ is minimized in local motion. The other lines fix the two fundamental Lagrangians $L$ .
(2)	$v \leq c$	Local energy speed $v$ is limited by the speed of light $c$ . This implies special relativity and restricts the possible Lagrangians.
(3)	$F \leq c^4/4G$	Local force $F$ is limited by $c$ and by the gravitational constant $G$ . This implies general relativity and fixes its Lagrangian.
(4)	$W \geq \hbar$	Action $W$ is never smaller than the quantum of action $\hbar$ . This implies quantum theory and restricts the possible Lagrangians.
(5)	$S \geq k \ln 2$	Entropy $S$ is never smaller than $\ln 2$ times the Boltzmann constant $k$ . This implies thermodynamics.
(6)	<b>U(1)</b>	is the gauge group of the electromagnetic interaction. It yields its Lagrangian.
(7)	<b>SU(3) and broken SU(2)</b>	are the gauge groups of the two nuclear interactions, yielding their Lagrangians.
(8)	<b>18 elementary particles</b>	– gauge bosons, the Higgs boson, quarks, leptons, and the undetected graviton – with all their quantum numbers, make up everything in nature and, with their interactions, fix the standard model Lagrangian.
(9)	<b>Finally, 27 numbers</b>	– dimensions, cosmological constant, coupling constants, particle mass ratios, mixings and phases – complete the two fundamental Lagrangians. They determine all observations and all colours.

Conclusion

Bonus Material

R. Penrose (Dirac's student) & W. Rindler, *Spinors and space-time*, vol. I (1984).

The scissors represent a spin 1/2 fermion.

The chair represents the cosmological horizon.

Only a (scissor) rotation by  $4\pi$  leads back to the original situation.  $2\pi$  does not.

**Is every particle tethered (attached) to the cosmological horizon? Yes.**

# Strands and Belts Explain Spin 1/2

Dirac's belt trick or string trick:

Double tethered particle rotation is no rotation.

Core/particle rotation by  $4\pi$  is equivalent to no rotation, for 2 or more strands.

# Spin Is Rotation

## Conclusion

## Bonus Material

© Jason Hise

The cubic centre represents a lepton tangle core.

As illustrated below, leptons have six tethers.

**A spinning particle is a rotating tangle core.**

Dirac's trick works with any number of tethers equal or larger than 3.

# Strands and Belts Explain Fermions

**The fermion trick:** Double tethered particle exchange is no exchange.  
The trick also works if some or all the strands *connect* one tangle core to the other core.

Double exchange is no exchange.

**The Dirac trick yields the fermion trick.**

The fermion trick works for any number of tethers.

**Spin 1/2 particles are fermions. This is (half) the spin-statistics theorem.**

# Paul Dirac's Letter to Martin Gardner

Dear Mr. Gardner:

I am sorry I was too busy to answer your letter earlier. I first thought of the problem of the strings about 1929. I used it to illustrate a property of rotations, that two rotations of a body about an axis can be continuously deformed, through a set of motions which each end up with the original position, into no motion at all.

It is a consequence of this property of rotations that a spinning body can have half a quantum of angular momentum, but cannot have any other fraction of a quantum.

Yours sincerely  
P.A.M. Dirac

Wave Functions

Gauge interactions

Gravitation

Conclusion

Bonus Material

M. Gardner, *Riddles of the Sphinx and Other Mathematical Puzzle Tales* (1987), page 47.

Rotations of tethered particles produce crossing switches.

A *crossing switch* is a change of overpass and underpass:

**Therefore, crossing switches yield Planck's quantum of action  $\hbar$ .**  
(L. Kauffman, 1987)

# Crossing Switches Define Planck's $\hbar$

The fundamental, Planck-scale principle of the strand tangle model

Strands have **Planck radius**. Strands are **unobservable**, impenetrable and featureless: no mass, no tension, no torsion, no branches, no fixed length, no ends. A **crossings** is the region of the smallest distance between two strands.

Every **event** is a **crossing switch** characterized by  $\hbar$ .

**All observables** are defined and measured in terms of crossing switches.

**Thesis:** This fundamental principle implies all of physics.

The principle implies general relativity (via  $F \leq c^4/4G$ ) and the standard model, with the three gauge groups and the known particles. And not more.

❖ Wave functions

❖ Spinning electron

Gauge interactions

Gravitation

Conclusion

Bonus Material

# Elementary Fermions Are Rational 3d Tangles

**Quarks** - 'tetrahedral' tangles made of two strands with four tethers (only simplest family members)

Parity  $P = +1$ , Baryon number  $B = +1/3$ , Spin  $S = 1/2$

Charge  $Q = -1/3$

Charge  $Q = +2/3$

**Leptons** - 'cubic' tangles made of three strands along coordinate axes (only simplest family members)

'Elementary' means 1 to 3 strands.

'Fermion' means localizable tangle with 2 or more strands.

These simplest tangles reproduce all quantum numbers.

No additional elementary fermions are possible.

No other explanation of the particle spectrum exists.

❖ Wave functions

❖ Spinning electron

Gauge interactions

Gravitation

Conclusion

Bonus Material

# Wave Functions Are Crossing Densities

The strand tangle model for **wave functions**

Step 1: Take the crossing midpoints and their phases of the above tangle.

**Crossing midpoints with their amplitudes and local phases**

Step 2: Take the time average of all crossing midpoints and phases to get the wave function.

The black dot specifies the crossing *position*, the shortest distance  $s$  determines the crossing *amplitude*, and the angle  $\alpha$  defines the crossing *phase*.

**Tangles are skeletons of wave functions.**

**Tangles follow the free Dirac equation.**  
(Battey-Pratt & Racey, 1980.)

Crossings have *amplitudes* (inverse distance) and *phases*.

Crossing densities of fluctuating tangles are **wave functions**: they yield Hilbert spaces, interference, decoherence, collapse, and entanglement. (Pedagogical link.)

**Dirac's equation is the infinitesimal version of Dirac's trick.**

Quantum of Action

Gravitation

Conclusion

Bonus Material

# Twists Generate Local U(1)

The **twist**, or **first Reidemeister** move, is related to a crossing switch:

Twists, performed by rotating the **encircled segment**, are thus **observable**.

A **double twist** of the **encircled segment** can be rearranged to an untwisted strand, keeping the encircled segment fixed in space: **no twist**:

In a fermion, the twist around a given axis thus **generates a local U(1) Lie group**.

Twists rotate the dotted circle by  $\pi$ . *Generalized* twists rotate the dotted circle by *arbitrary* angles. They form the local Lie group U(1). **Rotating twists also yield a model for the photon.** (More later on.)

Bonus Material

# Pokes Generate $SU(2)$ via the Belt Trick

The **poke**, or **second Reidemeister move**, on pairs of strands generates an  $SU(2)$  Lie group, because the three rotations by  $\pi$  generate the algebra of  $SU(2)$ :

Pokes, like belts, yield the Pauli matrices, i.e., the Lie algebra of  $SU(2)$ :

$$\tau_x = i\sigma_x = i \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix}, \quad \tau_y = i\sigma_y = i \begin{pmatrix} 0 & -i \\ i & 0 \end{pmatrix}, \quad \tau_z = i\sigma_z = i \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}$$

*Generalized* pokes, by *arbitrary* angles, yield the full local Lie group  $SU(2)$ . Maximal parity violation and  $SU(2)$  breaking also follow (see bonus material).

# Slides Generate Three Belt Tricks and $SU(3)$

Slides, or third Reidemeister moves, acting on strand pairs in three-strand structures, can be generalized to the generators of the Lie group  $SU(3)$ .

Slides rotate the dotted circle by  $\pi$ .

The deformations allow reading off the matrix representations (see next page).

$\lambda_3$ ,  $\lambda_9$  and  $\lambda_{10}$  are not linearly independent.

Traditionally,  $\lambda_3$  and  $\lambda_8$  are used.

$\lambda_8$  is the slide prototype.

Quantum of Action

- ❖ Elementary bosons

Gravitation

Conclusion

Bonus Material

# Slides Generate $SU(3)$ 's Gell-Mann Matrices

$$\lambda_1 = \begin{pmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}, \quad \lambda_2 = \begin{pmatrix} 0 & -i & 0 \\ i & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}, \quad \lambda_3 = \begin{pmatrix} 1 & 0 & 0 \\ 0 & -1 & 0 \\ 0 & 0 & 0 \end{pmatrix},$$

$$\lambda_4 = \begin{pmatrix} 0 & 0 & 1 \\ 0 & 0 & 0 \\ 1 & 0 & 0 \end{pmatrix}, \quad \lambda_5 = \begin{pmatrix} 0 & 0 & -i \\ 0 & 0 & 0 \\ i & 0 & 0 \end{pmatrix}, \quad \lambda_9 = \begin{pmatrix} -1 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 1 \end{pmatrix},$$

$$\lambda_6 = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 1 \\ 0 & 1 & 0 \end{pmatrix}, \quad \lambda_7 = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & -i \\ 0 & i & 0 \end{pmatrix}, \quad \lambda_{10} = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & -1 \end{pmatrix},$$

$$\text{and } \lambda_8 = \frac{1}{\sqrt{3}} \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & -2 \end{pmatrix}.$$

Of the ten slide deformations, only the first eight are linearly independent.

These eight deformations yield the Gell-Mann matrices.

The eight deformations generate the algebra of  $SU(3)$  – and describe gluons.

These eight generators also yield the relations  $\text{tr } \lambda_n = 0$  and  $\text{tr}(\lambda_n \lambda_m) = 2\delta_{nm}$ .

$SU(3)$  has three linear independent  $SU(2)$  subgroups – one in each row.

*Generalized slides, by arbitrary angles, yield the full Lie group  $SU(3)$ . (Publication link.)*

(for long observation times)

**Virtual pairs**  
(for short observation times)

**Curved vacuum** – an *irregular strand aggregate*

**Observation:**

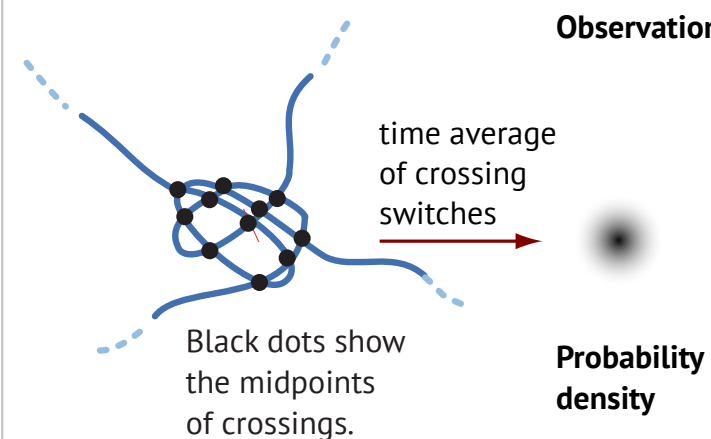

**Curved space**  
with non-trivial metric

**A black hole horizon** – a *weave* of strands

**Observation** after time average of crossing switches:  
a **horizon**, i.e., a thin spherical cloud, with mass,  
moment of inertia, entropy, and temperature.

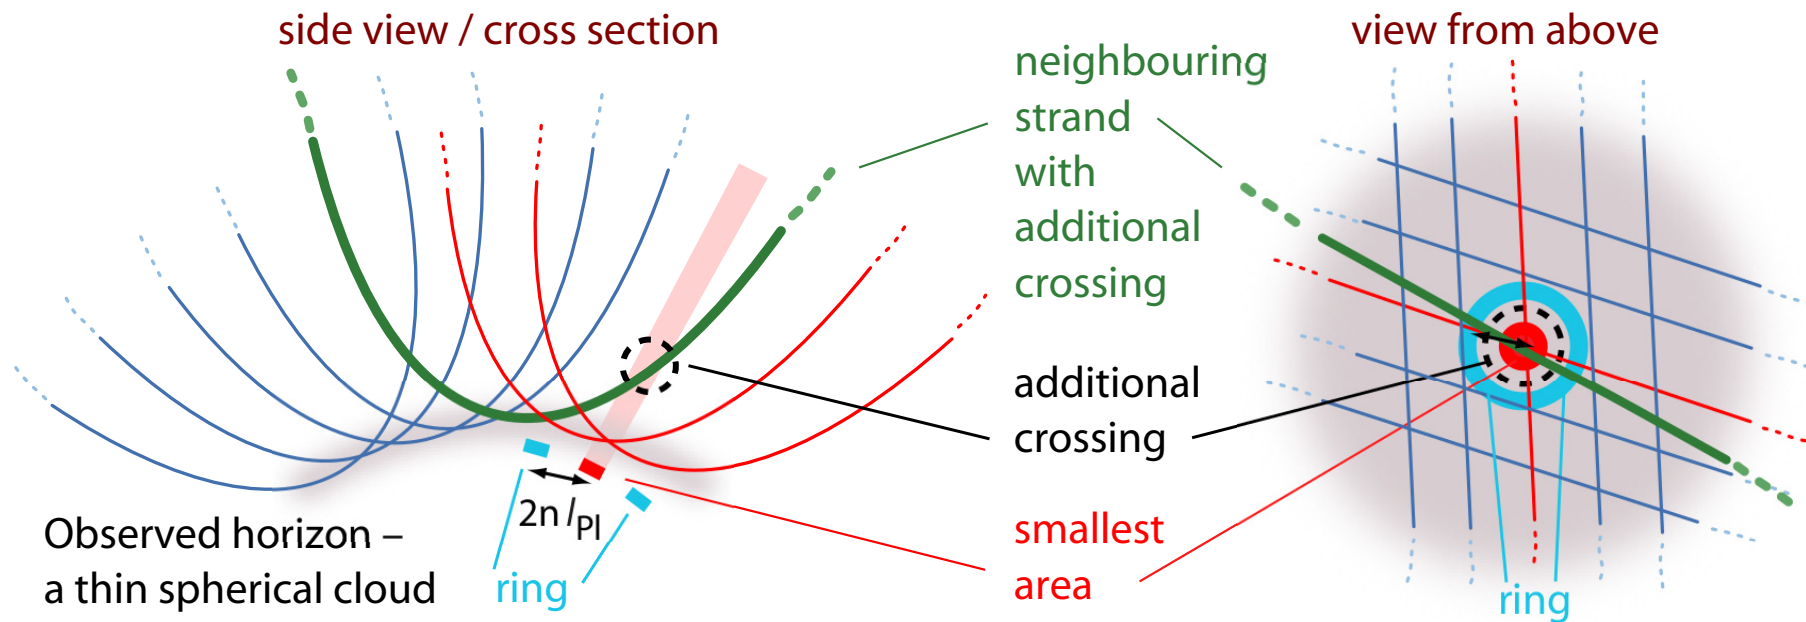

**A particle** – a *tangle* of strands

**Observation:**

**Probability density**

# Black hole horizon in the strand conjecture:

Observed horizon –  
a thin spherical cloud

The effective number  $n$  of possible microstates per smallest area:

$$n = 2 + \frac{1}{2!} + \frac{1}{3!} + \frac{1}{4!} + \frac{1}{5!} + \dots = e = 2.71828\dots$$

yields an entropy value  $S$  that depends on the area  $A$ : (Schiller 2009, 2019, 2023)

$$\frac{S}{k} = \frac{A}{4 \hbar G / c^3} - \mathcal{O}\left(\ln \frac{A}{4 \hbar G / c^3}\right)$$

The fundamental principle implies **black hole entropy**, energy, temperature – and evaporation: strands detach. Strands imply general relativity.

Strands imply **force**  $F \leq c^4 / 4G$ , **power**  $P \leq c^5 / 4G$ , **mass/length**  $m/l \leq c^2 / 4G$ , etc. Strands again imply **pure general relativity**.

Thus, **no** singularities, negative energy regions, wormholes, black hole hair, torsion, time-like loops, running of  $G$ , or new quantum gravity effects.

## Prove, clarify or disprove:

- No visualization of  $SU(2)$  or  $SU(3)$  without tethers is possible in 3 dimensions.
- No visualization of  $SU(n)$  with strands (or without strands) for  $n > 3$  is possible in 3 dimensions. (This has profound consequences for physics.)
- The rational tangle classification is mathematically complete and leaves no room for additional elementary fermions or bosons.
- The rational tangle classification is mathematically complete and leaves no room for additional defects in space that are neither fermions nor bosons.

## Determine:

- How does the probability of belt-trick-like rotation for a tethered ball depend on the chirality and size of the tethered structure and on the number of ropes? Use ideas from hydrodynamics of viscous liquids.
- Use the result to estimate neutrino masses. Ideally, before they are measured.
- Calculate the three gauge coupling constants from the average tangle shape.

## Earn prizes for specific math problems on knot theory:

# Spin 1/2, the Belt Trick and Dirac's Equation

Free particles (spinors) are (blurred) spinning tangle cores.

**Dirac's belt trick** allows continuous (tethered) rotation (see film © by Antonio Martos).

**Spin** is rotation; spin value is due to strand number and tangle details.

**Antiparticles** are mirror tangles with opposite belt trick.

**Particle momentum and energy** are core wavelength and rotation frequency.

**Quantum phase** is 1/2 of the orientation angle of the tangle core.

The **wave function** is the time-averaged ("blurred") tangle crossing density.

Maximum speed  $c$  and minimum action  $\hbar$  hold.

Strands imply the free **Dirac equation**  $i\hbar\gamma^\mu\partial_\mu\psi = mc\psi$  and its propagator.

(Battey-Pratt and Racey 1980) **Dirac's equation is due to Dirac's trick.**

The **principle of least action** ("cosmic laziness") is the *principle of fewest crossing switches*.

The rational 3d particle tangles also yield Higgs self-interactions.

No vertex of the standard model is missing.

Due to the tangle topologies, no additional vertices arise.

The full standard model Lagrangian arises.
